Preorders and ingredient records, connected.

Web-Based Preorder and Freshness Management System for Home-Based Entrepreneurs

Case study: Wrap & Bowl Kuch
Christopher Hansen · 2402081406

Supervisor: Ms. Nur Elana Binti Mohd Saferinor

A working system, explained through one customer and one owner workflow.

The gap is the connection between tasks.

- Advance dates can require separate coordination.
- Ingredient shelf life is not part of the ordering tools reviewed.
- A shared marketplace limits independent storefront presentation.
- Sales information and menu choices need useful, integrated support.

The five original objectives

1. To design and develop a web application that supports flexible date-based food preordering and scheduling for home-based food entrepreneurs.

2. To implement a food stock freshness monitoring feature based on ingredient shelf life and storage duration.

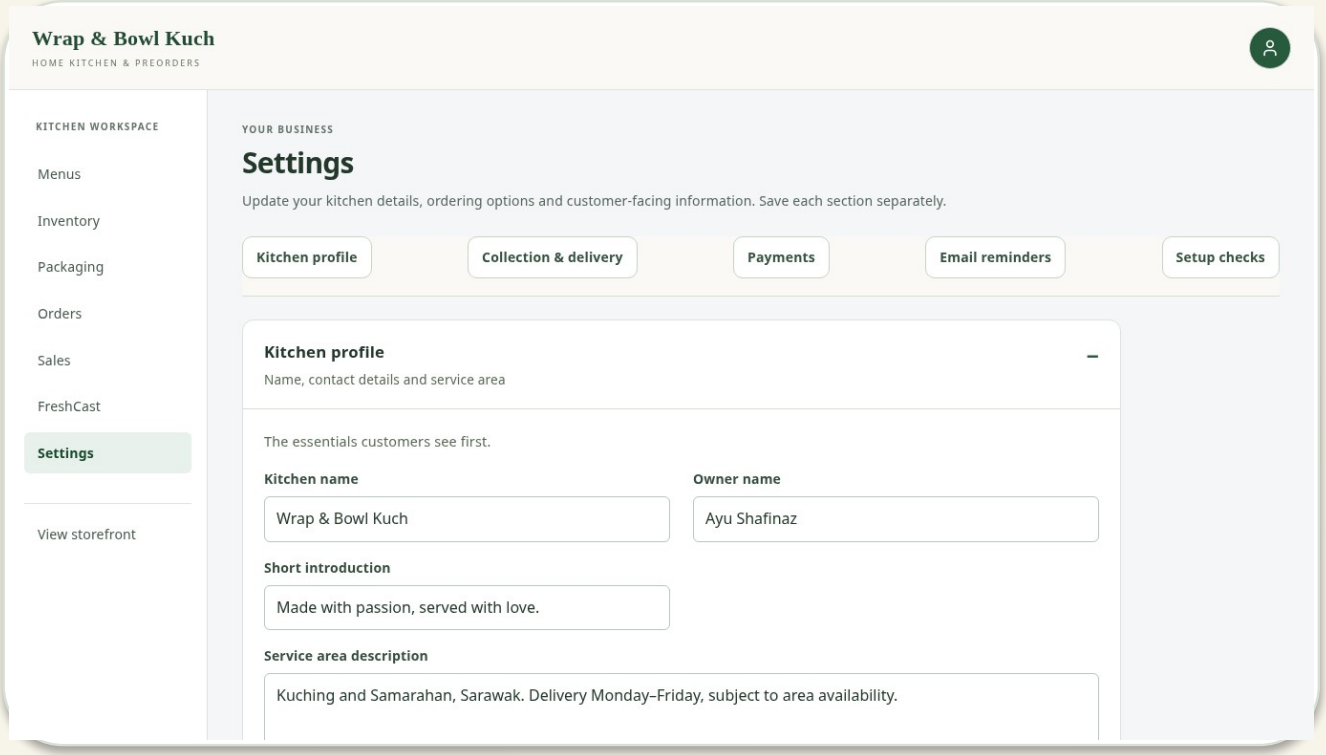

3. To develop a personalised single-vendor storefront module that allows sellers to strengthen branding without direct competitor distraction.

4. To implement a sales analytics dashboard that supports data-driven business decision-making for home-based food operators.

5. To develop a menu recommendation system that reduces customer decision fatigue and improves purchase conversion rates.

Client feedback shaped the implementation.

- Iterative development: requirement → implementation → check → feedback.
- Name and phone details, with passkey access.
- Morning delivery, area fees and optional collection.
- Packaging stock, payment evidence and simpler receipt status.

Current application capture · local example records

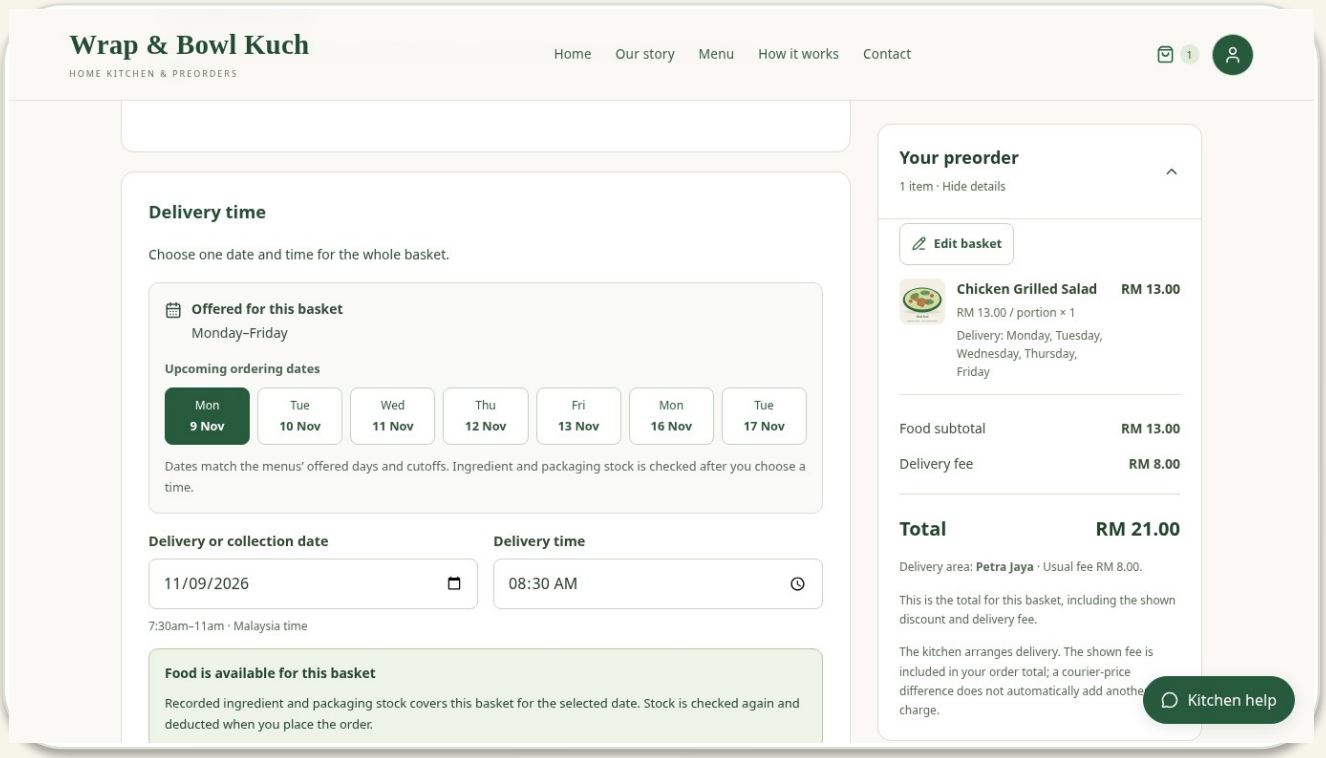

One order connects the records.

- Server checks price, offered days and recorded stock.
- Acceptance saves order details and deducts ingredients + packaging together.
- Owner reviews payment and actual food receipt separately.

Feature story 1: a practical preorder journey.

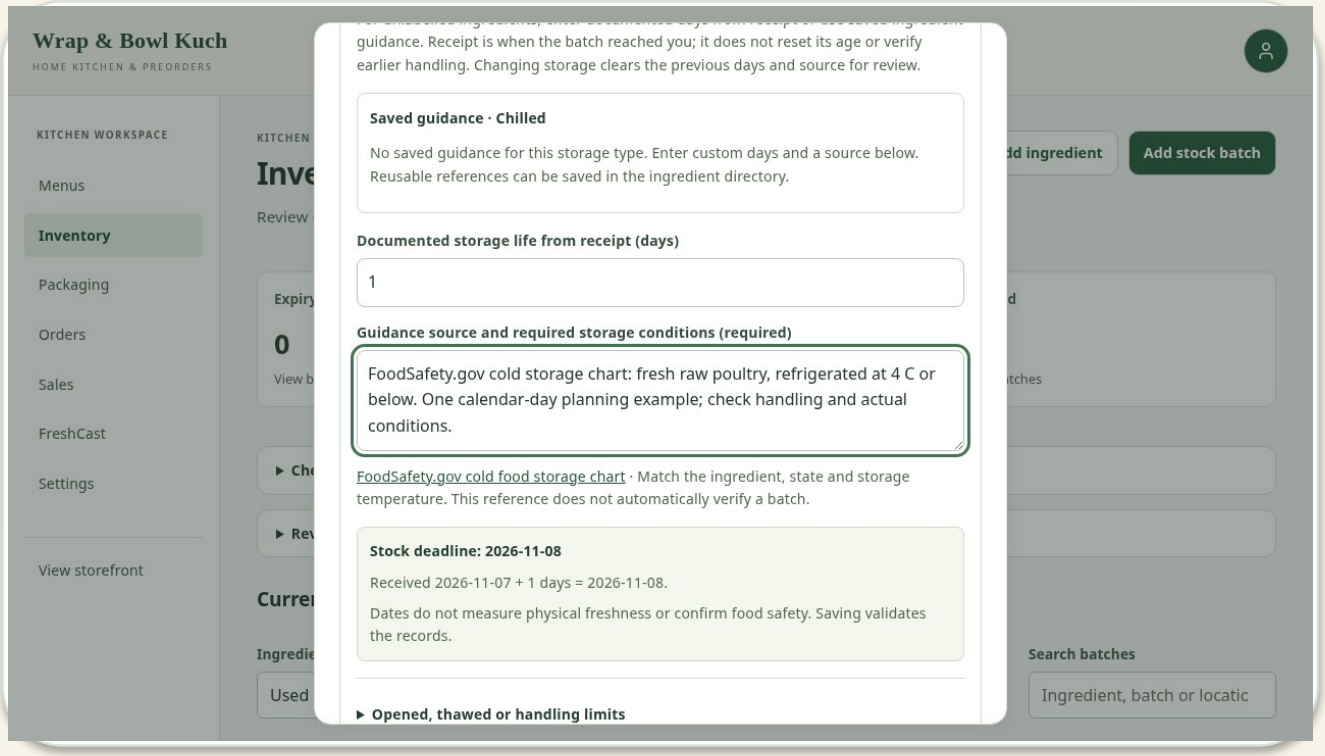

- Branded menu and clear selling units.
- Optional date, quantity and whole-order budget suggestions.
- Area-based delivery fees and checkout date guidance.
- Private receipt upload or delivery cash; QR-only collection.

Current application capture · local example records

Feature story 2: dates guide usable stock.

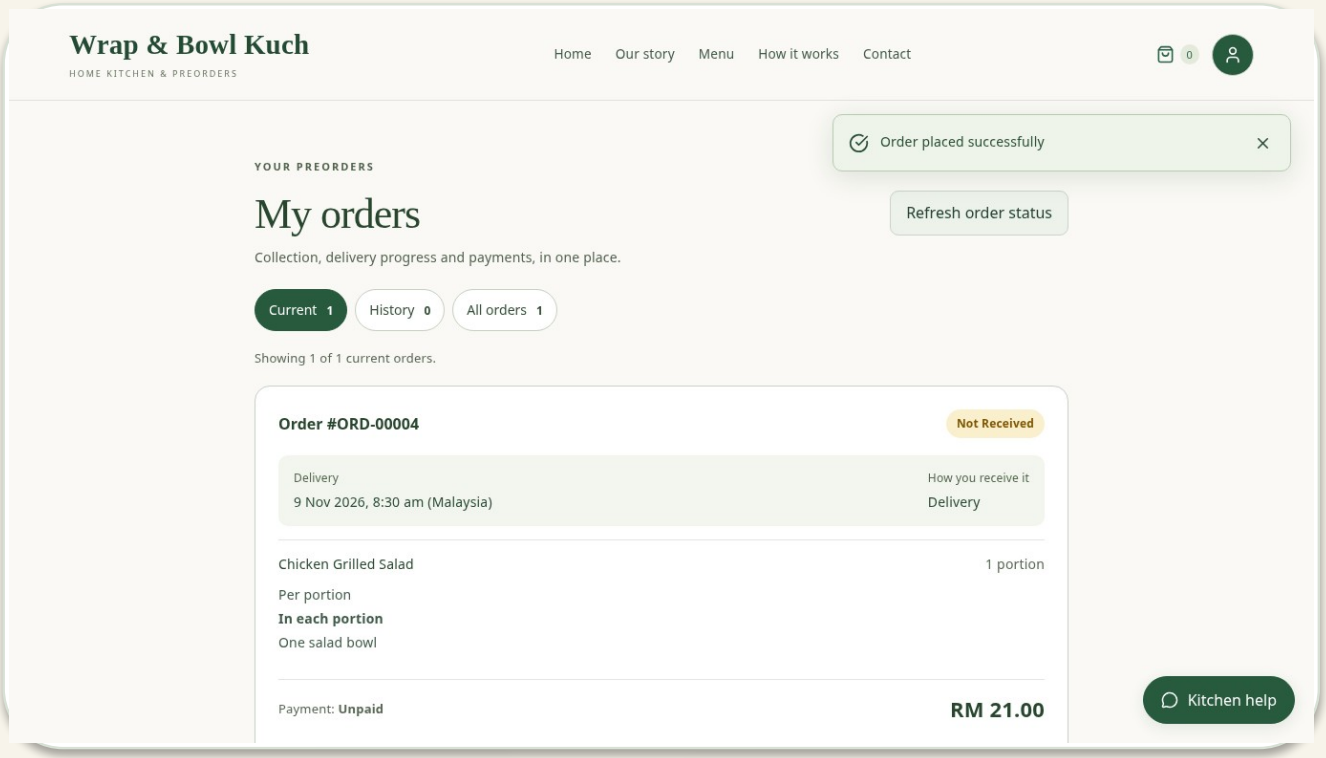

- Printed date, manufacture-based life or receipt-based storage life.
- Earlier recorded limits take priority.
- Held and past-deadline batches are excluded.
- Stock indicators are date-based—not a physical safety test.

Two-minute application walkthrough

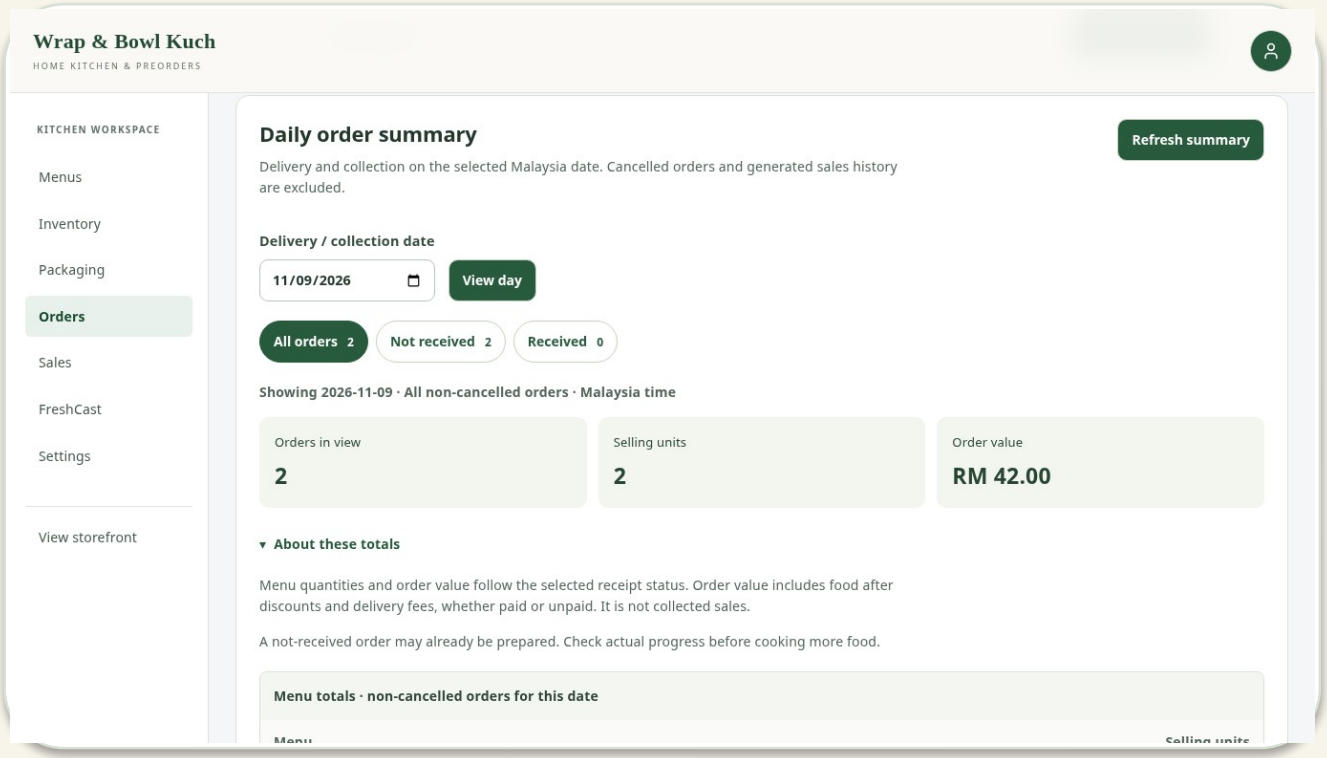

- Customer: menu → account → checkout → accepted order.
- Owner: review → ingredient and packaging balances → batch dates → reports.
- Fallback order: live walkthrough → recorded video → screenshot sequence.

Live → recorded MP4 → screenshot fallback

What the testing supports

- Functional checks: account access, dates, totals, stock, payment evidence and reports.
- Browser checks: customer and staff journeys, forms and layouts.
- Skipped checks remain separate from passes.
- Formal client acceptance and student evaluation are still pending.

Current application capture · local example records

The limits are part of the result.

- Date records depend on correct owner input and storage practice.
- Transfers and courier handover remain externally verified.
- Passkeys require compatible access and a saved credential.
- Real business impact and paid conversion are not yet measured.

A simpler workflow, with connected records.

- Flexible preorders for one home kitchen.
- Recorded ingredient life connected to order allocation.
- Own storefront, practical reports and optional recommendations.
- Implemented functions tested; user and business outcomes still to evaluate.
